

Clothing Manufacturing

Most clothing manufacturers create part numbers for their products that represent style, color and size. For example, if a product has the following part number 3410-BRN-SML, '3410' represents its Style Number, 'BRN' represents its color (Brown), and 'SML' represents its size (Small).

The Clothing Manufacturing extension streamlines your production process by allowing you to group production based on style and color. SAP's Material Requirements Planning (MRP) creates work orders for each style, color, and size. The Clothing Manufacturing extension enhances this function by creating a master work order which combines all style and color production work orders into one.

The illustrations below describe how the Clothing Manufacturing extension can improve your production efficiency.

When planning for production, you can use a Master Work Order to combine individual work orders for items with similar styles and colors.

A Cutting Ticket is then issued to estimate the amount of materials needed when creating production work orders.

The Clothing Manufacturing extension can improve your production efficiency by allowing you to:

- Consolidate production runs
- Schedule and manage items for creation or purchase
- Easily manage materials and work
