

# Quality

The Quality extension allows for the input of quality control information for received shipments. After receiving a shipment from a purchase order, you can key in test results to ensure its accuracy.

The illustration below highlights the key features of the Quality extension.

The screenshot shows the 'Material Receiving QC - Binoculars' window. It contains several data entry fields and tables. Callout boxes on the right point to specific features:

- Capable of tracking multiple cartons:** Points to a table with columns for 'Carton # / Quantity'.
- Stores in Inventory File:** Points to the 'Inspection Lot Qty' field.
- Keeps track of additional testing:** Points to the 'Function' section, which includes fields for 'Lens (Eyecup)', 'Lens (Viewfinder)', 'Adjustment Knob', 'Imprint Area', 'Cord W/Clip (W/Color)', 'Case', 'Holder', and 'Other 1' through 'Other 5'.
- Get Flexible:** A large box at the bottom right containing the text: 'Modifications can be input in-house or overseas via the web if used in conjunction with ABBASOFT's Pipeline extension.'
